

About Shibboleth

Stephanie Obodda - 2024-11-23 - Comments (0) - Shibboleth Single Sign On

The Shibboleth System is an open source software package for web single sign-on that is used at Brown. Anytime you see a screen like this, you are logging in to a single sign on service powered by Shibboleth:

A screenshot of a web authentication page. At the top left is the Brown University logo. To its right, the text "BROWN UNIVERSITY" is displayed in white on a dark red background. Below this, the heading "Authentication Required" is shown in a large, bold, black serif font. Underneath the heading is a light-colored rectangular box containing the login form. The form has the title "Enter your Brown credentials" and two input fields: "Username: *" with the text "jcarberr" entered, and "Password: *" which is empty. At the bottom of the form are two buttons: a grey "Continue" button and a red "Forgot your password?" link.

If you're interested, here are some of the technical details:

Shibboleth allows Brown services to validate a Brown user's identity, and to gain access to certain attributes about a person, such as display name, email address, or the groups that list the user as a member. Additionally, Shibboleth allows Brown service providers to allow external users into Brown services, based on a trust relationship between Brown and the external user's institutions through mutual membership in a federation. Likewise, Brown users may gain access to service providers at external institutions. Shibboleth provides the framework for these trust relationships, and grants a high degree of control over which service providers have access to which portions of a user's identity. Additional information about the Shibboleth project is available at <http://shibboleth.net>.

Historical background of Shibboleth

The Shibboleth project is a specific software solution to the problem of accurately identifying members of the Brown community and its external associates. Wikipedia describes the term as originating from the Hebrew word "shibboleth," which literally means the part of a plant containing grains, such as an ear of corn or a stalk of grain. It derives from an account in the Hebrew Bible, in which pronunciation of this word was used to distinguish members of a group (the Ephraimites), whose dialect lacked a /ʃ/ sound (as in shoe), from members of a group (the Gileadites) whose dialect did include such a sound.

In the Book of Judges, chapter 12, after the inhabitants of Gilead inflicted a military defeat

upon the tribe of Ephraim (around 1370--1070 BC), the surviving Ephraimites tried to cross the Jordan River back into their home territory and the Gileadites secured the river's fords to stop them. In order to identify and kill these disguised refugees, the Gileadites put each refugee to a simple test:

Gilead then cut Ephraim off from the fords of the Jordan, and whenever Ephraimite fugitives said, 'Let me cross,' the men of Gilead would ask, 'Are you an Ephraimite?' If he said, 'No,' they then said, 'Very well, say Shibboleth.' If anyone said, 'Sibboleth', because he could not pronounce it, then they would seize him and kill him by the fords of the Jordan. Forty-two thousand Ephraimites fell on this occasion.

- Judges 12:5-6, NJB

Fortunately, the modern use of the term Shibboleth is not nearly so draconian, but the point remains, that the Shibboleth software is used by service providers to authenticate members of the brown community, and to authorize users according to attributes released to service providers.
