How to Generate QR Codes for Webpages

A Quick Response (QR) code is a type of barcode that can store information, such as a website link. Generating a QR code for a webpage allows you to easily share that page with others, who can scan the code with a mobile device's camera.

Many common web browsers have built-in tools to create these codes.

Google Chrome

Google Chrome includes a built-in feature to create a QR code for your- current page.

1. Open Chrome and navigate to the page you wish to share.
2. Click the **More** icon (three vertical dots) in the top-right corner of the browser.
3. Select "**Cast, save, and share**" and then choose "**Create QR code**".
4. A QR code will be generated, which you can then **Download** as an image.

Microsoft Edge

Microsoft Edge also features a built-in QR code generator.

1. Go to the website you want to share.
2. Right-click on any blank area of the webpage.
3. Select "**Create QR code for this page**" from the context menu.
4. The QR code will be generated, allowing you to download it.

Mozilla Firefox

Firefox does not have a native, built-in QR code generator. To add this functionality, you must install a browser extension, known as an "Add-on."

1. Click the menu button (three horizontal lines) in the top-right corner and select "**Add-ons and Themes**".
2. In the search box, type "QR code generator".
3. Choose a well-rated add-on from the search results (such as "QR Lite" or "Offline QR Code Generator") and click "**Add to Firefox.**"
4. After installation, the add-on will typically place an icon on your toolbar or add an

option to your right-click menu to generate a code.

Apple Safari (macOS)

On a Mac, Safari does not have a direct right-click option for generating QR codes. The recommended native method is to use the **Shortcuts** app.

1. Open the **Shortcuts** app (it is located in your Applications folder).
2. Click the **plus icon (+)** to create a new shortcut.
3. In the action search bar on the right, type "Generate QR Code" and add it to your shortcut workflow.
4. You can set the shortcut to generate a code from your **Clipboard**.
5. To use it, copy a URL from Safari, then run the shortcut you created. The shortcut will generate the QR code, which you can then save.
