Using a Chromebook from a vendor like Google or Samsung can be a great way to access web resources in an easy-and-secure manner. However, Chromebooks aren’t well-suited for access to all Brown services, so they may not meet all your needs.

Chromebooks are integrated with the Chrome web browser, so work best for Brown services that are entirely web-based, like:

- Gmail
- Workday
- Self-Service Banner
- Canvas

Websites that do not need authentication are also well-suited for Chromebooks.

**Choosing the best login account for your Chromebook**

If you set up your Chromebook with a personal Google account like josiahcarberry@gmail.com, you will have a wider range of applications available in the Google Play store for you. Due to the way that the Play Store integrates with your Brown Google account, it’s not possible to install all apps if you log in to your Chromebook with your regular Brown address.

If you set up your Chromebook with your official Brown address, you may also see a “Managed by Brown” notice on your Chromebook. Please note: Brown is not actually managing your entire device. There are components of your Brown Google account that are handled by the University, and this notice refers to that management.

**Helpful Chromebook applications**
If you have your Chromebook set up for a personal address, you may want to install the Microsoft Remote Desktop app. Through this app, additional services such as Brown’s RemoteApp service or Remote Desktop access to a configured Windows server might be available to you.

Another app, the F5 Access for Android, will allow your web browser to behave as if it is on the Brown network. The VPN provides secure communications when you are connected to a public network.

To connect to a Zoom meeting from a Chromebook, the Zoom App is available to help you connect to meetings with audio and video, share your screen, and manage attendees.
